All women with depression in pregnancy

- Educate about depression, impact, and treatment options (include support systems when possible)
- Routinely monitor symptoms throughout pregnancy
- Address concurrent social, medical, and mental health problems

Emergency Department fact sheets

Abdominal Pain in Children

Queensland Health

health • care • people

www.health.qld.gov.au/emergency

What is abdominal pain?

Abdominal pain is pain or cramping anywhere in the abdomen (sometimes called a tummy, belly or stomach ache). Children often complain of abdominal pain. It is one of the most common reasons children come to the emergency department.

Most cases of abdominal pain are not serious and children often get better by themselves.

What causes abdominal pain?

There are many things that can cause abdominal pain:

- Bowel (gut) problems – such as constipation or irritable bowel.
- Infections – such as gastroenteritis (which causes vomiting and diarrhoea/runny faeces or poo) or urine infections.
- Food related – too much food, food poisoning or food allergies and intolerances.
- Surgical problems – such as appendicitis or a bowel obstruction.
- Period pain – some girls can also have monthly pain before or during their period.

Treatment

Abdominal pain can be hard to diagnose. Often the cause is not apparent and the symptoms may take some time to become obvious. Sometimes tests are needed. They may include:

- Blood tests
- A urine test
- A stool (faeces or poo) sample
- X-rays of the abdomen
- Ultrasound.

Some results may take a number of days to come back. Your local doctor will receive a letter advising them how to obtain the test results, or a hospital appointment will be made for you to return to get the test results (in the emergency department).

Treatment may be as simple as going home to rest, drink fluids and eat a bland diet. At other times, your child may be admitted to hospital or may need an operation (surgery).

Home care

There are some general ways to ease your child's pain.

- Ensure your child gets plenty of rest.
- Help your child drink plenty of clear fluids, such as water. Getting your child to drink is most important as it prevents dehydration (loss of water).
- If your child is hungry let them eat what they want or offer bland food such as crackers, rice, bananas or toast. Do not force your child to eat if they feel unwell. They will start eating when they feel better. Rubbing a child's tummy or having a distraction, such as reading a book, can sometimes ease the pain.
- Give paracetamol if your child is in pain or is miserable. Carefully check the label for the correct dose and make sure you are not giving your child any other products containing paracetamol. Only give as directed. Do not give your child aspirin.

What to expect

Many children with abdominal pain get better quickly, without any treatment and often no cause can be found.

Sometimes the cause becomes more obvious with time and treatment can be started. This is why it is important to see your local doctor for follow-up.

Repeated attacks of abdominal pain

Some children have repeated attacks of abdominal pain, which can be very worrying for parents. Often no health problem can be found. Children may have abdominal pain when they are worried about themselves or people around them.

Think about whether there is anything that is upsetting your child at home, school, kindergarten or with friends.

See your local doctor for advice. A referral may be needed to a paediatrician (a doctor who specialises in children) or gastroenterologist (a doctor who specialises in tummy problems).

Follow-up

- If pain or other problems persist for more than 24 hours, take your child to your local doctor. See your local doctor or health care professional as soon as possible if your child:

SUSPECTED PE DURING PREGNANCY

High pretest probability, or intermediate/low probability and positive D-dimer result

Anticoagulate with LMWH

- Chest X-ray^a
- Compression proximal duplex ultrasound, if symptoms or signs suggestive of DVT^b

Proximal DVT not present

SPECIFIC INVESTIGATION FOR PE

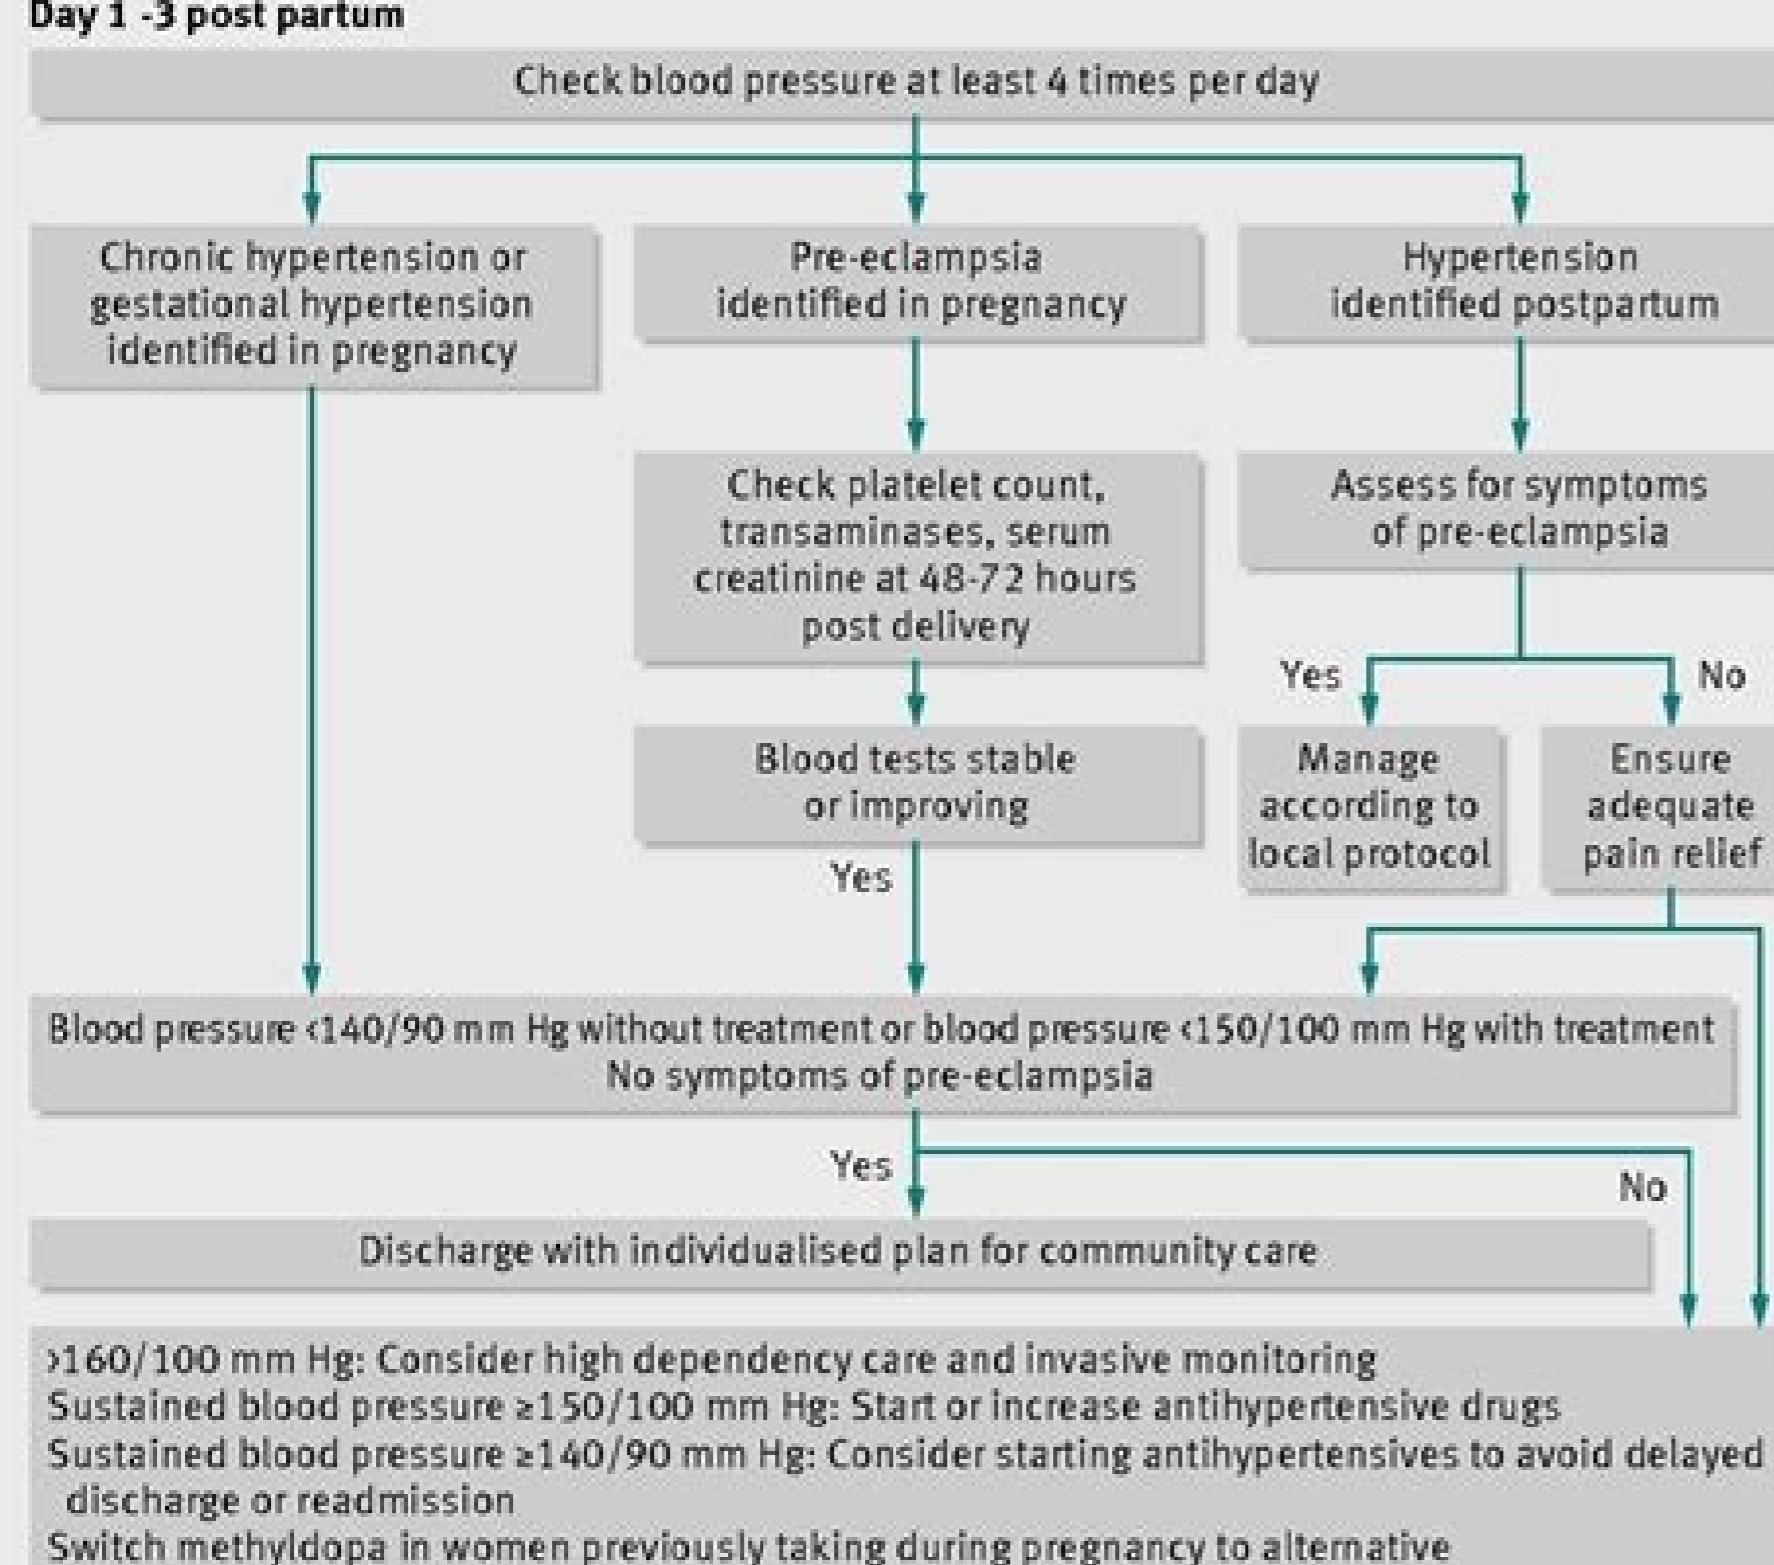

- If chest X-ray normal → CTPA or perfusion lung scan
- If chest X-ray abnormal^c → CTPA^c

Negative Indeterminate or positive

PE ruled out Review by radiologist or nuclear physician experienced in diagnosis of PE in pregnancy

Positive

- Continue with LMWH at therapeutic doses^d
- Assess PE severity and the risk of early death^e
- Refer to multidisciplinary team with experience of PE management in pregnancy
- Provide plan to guide management of pregnancy, labour and delivery, postnatal and future care

>160/100 mm Hg: Consider high dependency care and invasive monitoring
 Sustained blood pressure ≥150/100 mm Hg: Start or increase antihypertensive drugs
 Sustained blood pressure ≥140/90 mm Hg: Consider starting antihypertensives to avoid delayed discharge or readmission
 Switch methyldopa in women previously taking during pregnancy to alternative
